US-09-273-565-34

Patent No. 6166190 GENERAL INFORMATION:

Application US/09273565A

APPLICANT: FUJIWARA, TSUTOMU APPLICANT: WATANABE, TAKESHI APPLICANT: HORIE, MASATO

```
TITLE OF INVENTION: AN ISOLATED NUCLEIC ACID MOLECULE ENCODING HUMAN TITLE OF INVENTION: SKELETAL MUSCLE-SPECIFIC UBIQUITIN-CONJUGATING ENZYME FILE REEERBNCE: 0-53599

CURRENT APPLICATION NUMBER: US/09/273,565A

CURRENT FILING DATE: 1999-03-22

EARLIER APPLICATION NUMBER: 09/055,699

EARLIER APPLICATION NUMBER: 08/820,170

EARLIER APPLICATION NUMBER: 08/820,170

EARLIER APPLICATION NUMBER: JP 63410/1996

EARLIER APPLICATION NUMBER: JP 63410/1996

EARLIER FILING DATE: 1997-03-19

EARLIER APPLICATION NUMBER: JP 63410/1996

EARLIER FILING DATE: 1996-03-05

NUMBER OF SEQ ID NOS: 95

COPTIANDED: NOS: 95
                                                                    COUNTRY: United States of America
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTE: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25 (EPO)
CURRENT APPLICATION DATA:
                                                                                                                                                                                                                                                                                   TITLE OF INVENTION: Specific binding members, materials and TITLE OF INVENTION: methods.

NUMBER OF SEQUENCES: 53

The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC thinding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an CC infiammation, where they bind to the ZOT receptor in the intestinal CC and yet does not physiologically modulate the opening of TJ in the CC increased intestinal permeability and the peptide is useful for CC caused by infection, e.g. clostridium difficile infection, caused by infection, e.g. clostridium difficile infection, concerned by infection, bacterial overgrowth, whipple's disease, diseases with CC collagenous colitis, inflammatory bowel disease, diseases with correction of congenital heart disease, when the string intestion, e.g. congenital intestinal lymphanglectasia, correction of congenital heart disease with Fontan's operation, c.g. congenital intestinal intestinal special correction of congenital heart disease with Fontan's operation, c.g. congenital intestinal special correction of congenital heart disease with Fontan's operation, c.g. special disease, estimated by systemic lupus crythematosus or food allergies, primarily to consider the content of congenital heart disease with Fontan's operation, c.g. systemic lupus crythematosus or food allergies, primarily to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            C(TJ). The peptide antagonists are based on a common motif of zOT CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the zOT receptor in the intestinal cCC inflammation, where they bind to the zOT receptor in the intestinal cCC and yet does not physiologically modulate the opening of TJ in the CC increased intestinal permeability and the peptide is useful for CC treating intestinal permeability and the peptide is useful for CC crused by infection, e.g. Clostridium difficule infection, infestion, bacterial overgrowth, whipple's disease, diseases with CC infestation, bacterial overgrowth, whipple's disease, diseases with collars of conjustic obstruction, e.g. congenital intestinal lymphanisectasia, CC infestation of congenital heart disease, diseases marked by imphatic obstruction, e.g. congenital intestinal lymphanisectasia, CC infestation of congenital heart disease with Fontan's operation, collasses, without ulceration, e.g. Menetrier's disease, collasses, without ulceration, e.g. Menetrier's disease, cc e.g. systemic lupus erythematosus or food allergies, primarily to maik.

It may also play a role in breast cancer, glioblastomas, and pitultary adenomas. Zneul may also be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC C74446 to C77606 encode the proteins given in B40237 to B43397, which CC represent the human ORFX open reading frames 1 to 3161. The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; cantiporiatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; cc anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cc anticonvulsant; antiparkinsonian; vasotropic; antidiabetic; hypotensive; cd armatological; immunosuppressive; antiinflammatory; antibacterial; cc sequences can be used for determining the presence of or predisposition cc sequences can be used for determining the presence of or predisposition con or preventing or treating pathological conditions associated with an cc proteins in gene therapy vectors. The proteins and nucleic acids may be clasurers, osteoarthritis, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, cc storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The OREX CC sequences have activities such as cytostatic; hepatotropic; vulnerary; cc antipsoriatic; antiparkinsonian; notropic; neuroprotective; osteopathic; cc anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cartiviral; immunosuppressive; antidiabetic; hypotensive; cc antiviral; immunosuppressive; antitiflammatory; antibacterial; cc antiviral; antifungal; antirheumatic; antitiflammatory; antibacterial; cc sequences can be used for determining the presence of or predisposition cc or preventing or treating pathological conditions associated with an proteins in gene therapy vectors. The proteins and nucleic acids may be cc disorders, osteoarthritis, graft vs host disease, cardiovascular disease, corage, systemic lupus crythematosus, severe combined immunodeficiency considers, asthma, allergies, aplastic anaemia, burns, wounds, bone and cc cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to xx enhance coagulation; to inhibit thrombosis; and as a contraceptive.

Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to reconstruction.

Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed zneul polypaptides (see also W88382-97), including specific domains of zneul and epitope-bearing portions of zneul, can be used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC This invention describes novel cDNA sequences (A) highly expressed in CC normal uterine tissue which can have anticancer and cytostatic activity CC and can be used for gene therapy. (A) are used (i) for recombinant CC expression of polypeptides (B) and (ii) to isolate complete genes. (C (B) are used (i) to identify agents suitable for treatment of uterine CC expression from gene therapy vectors) and (iii) for generation of CC expression from gene therapy vectors) and (iii) for generation of CC expression promains a particular tissue type before comparison of CC expression patterns. This allows a significantly longer fragment of the CC expression patterns. This allows a significantly longer fragment of the CC expression patterns. This allows a significantly longer fragment of the CC expression patterns as os should reduce the number of failures associated CC different parts of the same unknown gene, distorting the estimated CC frequency of occurrence in a particular tissue. Y59838-Y59892 represent CC protein fragments encoded by the human uterine tissue derived cDNA xx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
Best Local
Y52138-Y52140 are amino acid sequences of spliced variants (T125). The T125 protein (Y52137) has two epidermal growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (EGF)-like domains at amino acids 107-134 and 141-176 and is predicted to have a molecular weight of approximately 30kD. T125 is predicted to have rotansmembrane domains and appears to be a secreted protein. The sequences of all variants of T125 are used in the invention to create antibodies which selectively bind to T125. The T125 polypeptide is used to modulate a variety of cellular processes. It can be used to produce to identify T125 antagonists and agonists. The T125 polypucleotides, and polypeptides, homologues and antibodies can be used in screening assays; predictive medicine; and methods of treatment of T125 associated disorders. The T125 polynucleotides can be used to express the protein; to detect T125 mRNA; to detect genetic alterations in the T125 gene; in forensic biology; and as a source of primers and probes.
                                                                                                                                                                                                                                                                                                                                                                        Domain
                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This polypeptide comprises human Zneul mature polypeptide. Zneul is a new neuro-growth factor-like protein (see also W88381). Its closest human homologue is HSMHC3W5A, a gene in the HLA class III region, which is contained in a cosmid which contains Notch 4.

Zneul is also homologues to Notch 4 in its EGF-like domains and may be involved in EGF receptor pathways. Zneul is widely expressed in adult tissues, with high expression in heart, placenta, spleen, testis, thyroid, spinal cord and lymph node. Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may play a role in breast cancer, glioblastomas, and pituitary play a role in breast cancer, glioblastomas, and pituitary play a role in breast cancer, glioblastomas, and pituitary cancer, to repopulate blood cells after chamotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORRY-associated disorder. The nucleic acids can be used to express ORFY proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, amplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 199

                                                                                                                                                                                                                                                                                  Human; PRO; EST; expressed sequence tag; PCR primer; hybridisation; probe; blood coagulation disorder; cancer; cellular adhesion disorder; secreted protein; transmembrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 2338) and v41685 to v41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                               08-MAR-1999;

                                                                                                                                                                                      The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases and include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies, 233891 to 234338, and 741685 to 741774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score

J. Biol. Chem. 267:18199-18204(1992).

C. -!- FUNCTION: IT IS INVOLVED IN THE REGULATION OF THE BIOSYNTHESIS AND BIOLOGICAL FUNCTION OF GLYCOPROTEIN OLIGOSACCHARIDES. CATALYZES THE ADDITION OF N-ACCTYLCLUCOSAMINE IN BETA 1-4 LINKAGE TO THE GETA-LINKED MANNOSE OF THE TRIMANNOSYL CORE OF N-LINKED SUGAR.

C. CHAINS. IT IS ONE OF THE MOST IMPORTANT ENZYMES INVOLVED IN THE CHAINS. IT IS ONE OF THE MOST INFORTANT ENZYMES INVOLVED IN THE CHAINS. IT IS ONE OF THE MOST INFORTANT ENZYMES INVOLVED IN THE CHAINS. IT IS ONE OF THE MOST INFORTANT ENZYMES INVOLVED IN THE CHAINS. IT IS ONE OF THE MOST INFORTANT ENZYMES INVOLVED IN THE CHAINS. IT IS ONE OF THE MOSTUTION OF GLYCOPROTEIN OLIGOSACCHARIDES.

C. --- CATALYTIC ACTIVITY: UDP-N-ACCTYL-BETA-D-MANNOSYL-1, 3-(N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 5)-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 5-(N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 4-N-ACETYL-BETA-D-
